

ADVANCED SEXUAL WELLNESS FOR MEN

Experience your full potential

P-Stem Protocol

The P-Stem protocol is a Platelet-Rich Plasma (PRP) therapy for penis rejuvenation combined with ALMI™ (autologous lipocyte micronized injection) and fat-derived stem cells. The protocol can help men with enhancement of erection, sensitivity and penis size.

The P-Stem protocol begins with a mini-liposuction that will extract a small amount of fat. From this, the multi-potent stem cells are obtained. Blood is drawn to isolate the PRP that will be administered along with the stem cells. Topical anesthetic will then be applied to the penis, and left on for 20 minutes to ensure maximum comfort. The PRP/stem cell combination is then administered to the penis.

Why P-Stem is an Optimal Protocol

Male-enhancement prescriptions such as Viagra™ and Cialis™ can bring about side effects such as headaches, dizziness, fainting, nausea and vomiting, stuffy and runny nose, visual changes, and flushing. Men taking medications for heart-related issues may not react well to erectile dysfunction (ED) medications.

The P-Stem protocol utilizes elements from within your body that promote tissue rejuvenation. Harvested stem cells from fat have shown potential to further enhance the healing when used alongside PRP. The P-Stem protocol can even be used in conjunction with ED medications to enhance results, if approved by a physician. Overall, the P-Stem protocol is a minimally invasive treatment with minimal side effects, with significant healing potential.

If you are interested in learning more about the P-Stem Protocol, call our office to set up a consultation.

ADVANCED SEXUAL WELLNESS FOR WOMEN

Enhance your pleasure and desire

O-Stem Protocol

The O-Stem protocol is an injectable treatment that uses regenerative substances harvested from the body to stimulate renewal and age reversal at a cellular level. The protocol is minimally-invasive, relatively painless and can produce long-lasting results. The treatment begins with the extraction of stem cells using a comfortable liposuction technique. Platelet-rich-plasma (PRP) is also collected through a simple blood draw.

When stem cells and PRP are injected into the vaginal tissue, they stimulate a healing response in the vagina and clitoris. As the tissue is rejuvenated, you may notice many improvements in your sexual function, including:

- Increased sexual desire
- More frequent orgasms
- Stronger orgasms
- Tighter vaginal skin
- Increased sensitivity

Why O-Stem is an Optional Protocol

There are a variety of procedures today that promise to rejuvenate the vaginal area and revive your sex life. The following are reasons why O-stem protocols may offer superior results over these other options:

- Minimally-invasive treatment requiring minimal recovery afterward
- Performed using local anesthetic and topical numbing cream
- Protocol utilizes the natural processes of the body
- Minimal side effects

If you are interested in learning more about the O-Stem Protocol, call our office to set up a consultation.
